What we learned

1. that working with web archives is highly dependent on the quality of the data and the context and constraints with which it was collected.

2. The framework is cool, but requires programming skillz (command-line comfort, which mean greater opportunities for digital training needed for humanities scholars.)

3. You have to know how to create your own datasets or get ahold of WARC files.  
MOU Economy? How do we surface WARC files for this type of work?

4. Need to link efforts among Canadian institutions, a community of web-archiving people, and archives unleashed can be hybrid community to bring Librarian/Archivist folks with the Historian folks.

## Problems

1. Crawler trap baggage (West Point Grey);

510255 URLs

510242 were 404s.

Out of those 13 that were “good” , only 7 were real information, the other 6 were redirects

2. Topic Modeling: Noise in the data. Special Characters. (Null characters encoding)

# With Ian and future historians in mind...

Where's the measure of completeness, and how do you build that into the web archive?

Historian | Archivist | Librarian | Systems |
